1. Description

1.1 General Description

The White LED, which was fabricated by using a blue chip and the phosphor.

Product Package: 3.0mmX1.4mmX0.7mm.

@98ž

ž

. ' " \$aaL% (aaL\$ " +aa

1.2 Features

PLCC Package. PLCC

Wide viewing angle.

Suitable for all SMT assembly and solder process.

GAH

Available on tape and reel.

Moisture sensitivity level: Level 3.

@j Y`

RoHS compliant. Fc<G

1.3 Application

LCD Back Light. LCD

1.4 Package Dimension

1.5 Product Parameters

Table 1-1 Electrical / Optical Characteristics at Ts=25°C

Item	Symbol	Test Condition	Value			Unit
			Min.	Typ.	Max.	
Forward Voltage	V_F	IF=80mA	---	3.0	---	V
Reverse Current	I_R	$V_R=5V$	---	---	1	uA
Luminous Intensity	I_v	IF=80mA	---	24	---	lm
Viewing Angle	2 1/2	IF=80mA	---	120	---	deg

Table 1-2 Absolute Maximum Ratings at Ts=25°C

Parameter	Symbol	Rating	Units
Forward Current	I_F	120	mA
Peak Forward Current	I_{FP}	150	mA
Reverse Voltage	V_R	5	V
Electrostatic Discharge (HBM)	E_{SD}	2000	V
LED Junction Temperature (LED)	T_j	105	
Operating Temperature	T_{OPR}	-30 ~ + 85	
Storage Temperature	T_{STG}	-40~+100	

Notes

1. 1/10 Duty cycle, 0.1ms pulse width.
2. The above forward voltage measurement allowance tolera
3. The above color coordinates measurement allowance toler
4. The above luminous intensity measurement allowance tole
5. Care is to be taken that power dissipation does not exceed
6. All measurements were made under the standardized envi
7. When the LEDs are in operation the maximum current shou
temperature, junction temperature should not exceed the m

2.5 Criteria For Judging Damage

Table 2-7 Criteria For Judging Damage

Test Items	Symbol	Test Condition	Criteria For Judgement	
			Min.	Max.
Forward Voltage	V_F	IF=80mA	-	>U.S.L*)x1.1
Reverse Current	I_R	$V_R = 5V$	-	>U.S.L*)x2.0
Luminous Flux		IF=80mA	<L.S.L*)x0.7	-

Notes

- 1.U.S.L: Upper standard level
- 2.The above reliability tests is based on the test platform,the reliability experiment was carried out on the LED to the series and parallel circuit, voltage distribution, heat dissipation and so on.
- 3.The technical information shown in this document is for reference of the referenced products. It does not constitute a license.

3. SMT Reflow

3.1 SMT Reflow Soldering

Fig.3-1

Fig.3-2 SMT Reflow Soldering Instructions SMT

Average temperature rise speed	T_{smax} T_P	5 °C/	Max 5 °C/ s
Preheating: minimum temperature	(T_{smin})	160 °C	
Preheating: Max temperature	(T_{smax})	260 °C	
Preheating: Time	T_{smin} T_{smax}	60 - 120	60s-120s
Time limited to maintain high temperature: the temperature	(T_L)	217 °C	
Time limited to maintain high temperature: The Time	(t_L)	60	Max 60s
Peak /Classification of temperature:	/ (T_P)	260 °C	
Time limit classification of peak temperature time	t_p	10	Max 10s
(T_P) 5 °C actual peak temperature (TP)	Hold time within 5 °C with the	30	Max 30s
Cooling speed		6 °C/	Max 6 °C/ s
25 °C	Needed time from 25 °C to T_p	8	Max 8 minutes

Notes

(1)Reflow soldering should not be done more than twice. If more than 24 hours between the two solderings , LED will be damaged.

24 LED

(2)Whensoldering , do not put stress on the LEDs during heating.

3.1.1 Soldering Iron

(1) When do soldering by hand, keep the temperature of iron below less 300 less than 3 seconds.

300 3

(2) Soldering by hand should be done only one time.

3.1.2 Repairing

Repairing should not be done after the LEDs have been soldered. When repairing is unavoidable, a double-iron should be used (as below figure). It should be confirmed in advance whether the characteristics of LEDs will be damaged by repairing.

LED

3.1.3 Cautions

(1) The encapsulated material of the LEDs is silicone. Therefore the LEDs have a soft surface on the top surface. If the top surface will be impacted on the reliability of the LEDs. Precautions should be taken to the encapsulated part. So when using the picking up nozzle, the pressure on the silicone resin should be

LED

(2) Components should not be mounted on warped (non coplanar) portion of PCB. After soldering, the board should be flat.

PCB

(3) Do not apply mechanical force or excess vibration during the cooling process to normal temperature. The device should be rapidly cooled after soldering.

4. Handling Precautions

4.1 Handling Precautions

(1) LED operating environment and sulfur element composition cannot be over 100PPM in the LED operating environment. This is provided for informational purposes only and is not a warranty or endorsement.

100PPM.

(2) In order to prevent external material from getting into the inside of LED, which may cause the content of Bromine element is required to be less than 900PPM, the single content of Chlorine element is required to be less than 900PPM, the total content of Bromine element and Chlorine element in the external materials of the LED is required to be less than 1500PPM. This is provided for informational purposes only and is not a warranty or endorsement.

LED

LED

900PPM

1500PPM.

(3) VOCs (Volatile organic compounds) emitted from materials used in the construction of fixtures and encapsulants of LEDs and discolor when exposed to heat and photonic energy. The result can be

from the fixture. Knowledge of the properties of the materials selected to be used in the construction of fixtures can help prevent these issues. LT advises against the use of any chemicals or materials that have been found or are suspected to have an adverse effect on device performance or reliability. To verify compatibility, LT recommends that all chemicals and materials be tested in the specific application and environment for which they are intended to be used. Attaching LEDs, do not use adhesives that outgas organic vapor.

LED

LED

LED

LED

(4) Handle the component along the side surface by using forceps or appropriate tools; do not directly touch or Handle the silicone lens surface, it may damage the internal circuitry.

(5) In designing a circuit, the current through each LED must exceed the absolute maximum rating specified for each LED. In the meanwhile, resistors for protection should be applied, otherwise slight voltage shift will cause big current change, burn out may happen. The driving circuit must be designed to allow forward voltage only when it is ON or OFF. If the reverse voltage is applied to LED, migration can be generated resulting in LED damage.

LED

LED

(6) Thermal Design is paramount importance because heat generation may result in the Characteristics decline, such as brightness decreased, Color change and so on. Please consider the heat generation of the LEDs when making the system design.

LED

(7) Compared to standard encapsulants, silicone is generally softer, and the surface is more likely to attract dust requiring special care during processing. In cases where a minimal level of dirt and dust particles cannot be guaranteed, a suitable cleaning solution must be applied to the surface after the soldering of components. LT suggests using isopropyl alcohol for cleaning. In case other solvents are used, it must be assured that these solvents do not dissolve the package or resin. Ultrasonic cleaning is not recommended. Ultrasonic cleaning may cause damage to the LED.
